**Syncope Adult & Pediatric  2.22**

**EMT STANDING ORDERS**
- Routine Patient Care.
- Maintain oxygen saturation 94 - 99%.
- Attempt to determine the cause of syncope.
- Perform cardiac monitoring; obtain 12-Lead EKG, if available. If acute coronary syndrome is suspected, refer to *Acute Coronary Syndrome Protocol 3.0*.
- Obtain blood glucose analysis; refer to *Hyperglycemia 2.7 A&P or Hypoglycemia 2.9 A&P Protocols*, if indicated.
- Assess for trauma either as the cause of the syncope or as a consequence of the syncopal event assess for trauma; refer to *Spinal Injury Protocol 4.5* if indicated.
- Prevent and treat for shock; see *Shock- Non-traumatic 2.19 or Shock - Traumatic Protocol 4.4*.
- Consider ALS intercept.

**ADVANCED EMT STANDING ORDERS**
- Consider fluids per *Shock – Non-traumatic Protocol 2.19*.

**PARAMEDIC STANDING ORDERS**
- Observe for and treat dysrhythmias as indicated.

**PEARLS:**
- Syncope is defined as a loss of consciousness accompanied by a loss of postural tone with spontaneous recovery.
- Consider all syncope to be of cardiac origin until proven otherwise.
- While often thought as benign, syncope can be the sign of more serious medical emergency.
- Syncope that occurs during exercise often indicates an ominous cardiac cause. Patients should be evaluated at the ED. Syncope that occurs following exercise is almost always vasovagal and benign.
- Prolonged QTc (generally >500ms) and Brugada Syndrome (incomplete RBBB pattern in V1/V2 with ST segment elevation) should be considered in all patients.
- There is no evidence that supports acquiring orthostatic vital signs.
- Syncope can be indicative of many medical emergencies including:
  - Myocardial infarction
  - Pulmonary embolism
  - Cardiac arrhythmias,
  - Vaso-vagal reflexes
  - Diabetic emergencies
  - Poisoning/drug effects
  - Dehydration
  - Hypovolemia
  - Seizures
  - Ectopic pregnancy
